How do you like it? You can share your opinion with the other readers. Our team works hard to choose the best manga and comics from thousands of popular and interesting anime titles. Tuesday, July 28, 2012 Beware of the Meltdown In yesterday's post, I mentioned that the Chinese authorities are somewhat ambiguous about cracking down on virtual private network (VPN) usage. They seem to take a sort of "hands off approach" to VPNs; they make it clear that such services are being actively encouraged and even officially promoted by the Chinese government; but once you have a VPN account, or even if you just use one that belongs to someone who has an account, you are not supposed to do anything that could be remotely seen as in opposition to the Chinese government. This leads me to ask: in a country where there is a "choice" of officially encouraged and tolerated VPNs, who is going to use the ones that are actually anonymous? It is almost certainly a safe bet to assume that the VPNs used by foreign journalists and bloggers (both in China and out) are going to be the ones that are available and that are actually going to do anything at all to protect their users' privacy. These VPNs will either be set up by the foreign media themselves, or by their freelancers or contractors. I expect that China's official VPN providers, if they exist, are more likely to cater to local people and probably serve other purposes as well (but this is pure speculation on my part). The trouble is that there are so many big VPN services out there that everyone who wants one can easily find one. (For example, the big free services are mostly in the U.S., which is not a country with particularly strict controls on internet access.) If you're a big news outlet or a big player in any other kind of business with a need to connect to the outside world, who are you going to trust? Nobody has built a reputation of reliability in China yet. You can probably trust the VPN providers that are based in countries with very strict laws, but not the ones based in the U.S., where not only are there fewer laws, but also fewer controls on access. So who's going to be the China-based VPN that builds up a reputation of reliability and trust? Who's going to have the best VPN service to offer, and why? China has a lot of options, but in this post-Snowden situation, the answer may be
